Parsimonious Voice Leading and the
Stimmführungsmodelle

Ariane Jesulat

KEYWORDS: diatonic voice leading patterns, partimento, neo-Riemannian theory, N-
transformation, Parallelismus, Carl Friedrich Weitzmann, Simon Sechter, Josef Riepel, Montesquenz,
Brahms “Feldinsamkeit,” Schubert Symphony in C major D. 944, double agent complex

ABSTRACT: This article confronts the dialectic between parsimonious voice leading, as represented
by neo-Riemannian theory, and the diatonic Stimmführungsmodelle, or the traditional formulas and
methods of thorough-bass pedagogy as they were preserved in the nineteenth century. The
historical contexts are represented by Carl Friedrich Weitzmann’s essay on the augmented triad
(1853) and Simon Sechter’s Generalbass-Schule (1835). The possibility of setting the diatonic and
chromatic models into productive analytic practice is explored, even as it is acknowledged that they
are grounded in different principles. Steven Rings’s “syntaxical interaction” and Richard Cohn’s
“double syntax” are invoked. A Brahms song and a Schubert symphony serve as extended
analytical examples.

1. Historic and Systematic Aspects: Coexistence of Different Scientific Paradigms

1.1. Introduction

[1] In the third book of the Traité complet de la théorie et de la pratique de l’harmonie, François-Joseph
Fétis rejects the approach of his contemporaries as he emphasizes a stark change of paradigm from
modal unisonalité to modern — that is, post-Rameau — approaches to tonality (1844, III, 158). Fétis
asserts, for example, that the tonal organization of the opening of Palestrina’s “Stabat Mater”
cannot be related to modern tonality at all, not in a single note — see Example 1. His
uncompromising attitude is all the more remarkable in that most nineteenth-century scholars
would not have missed an opportunity to interpret this cadence as a harmonic anachronism, to say
nothing of the stepwise root progression in the three opening chords.

[2] The attentiveness to historical change that Fétis shows might also be useful in explaining a
number of qualitative and categorical issues in the more recent history of music theory. Using the
idea of parsimonious voice leading, this article discusses and compares the different categorical
levels that an analysis must integrate within its scope when music theory confronts nineteenth-
century patterns of voice leading that have lost contact with the eighteenth-century stylistic
tradition of figured bass. An analyst may still be able to find traces of former partimento patterns in
Romantic music (although it might require a certain degree of creative abstraction), but these are
irreconcilable with the neo-Riemannian idea of the semitone as “minimal work unit” in triadic
transformation. This intellectual gap separates not only two different perspectives of harmony and
counterpoint (as shown by Fétis), but also represents a theoretical problem in itself.

[3] Renate Lachmann (1993, XX-XXVII) has described four paradigms for reconstructing culture by
means of memory, two of which seem to conflict: the diagrammatic paradigm organizes
knowledge systematically by means of the scientific method and various symbols with the aim of
producing valid, universal models, but the mnemonic (or diegetic) paradigm forms the
background for narrative and interpretative processing of data in the manner of the humanities
and historical research. Parsimonious voice leading, being a tool belonging to the more systematic
approach, is neither fallible nor open to interpretation, whereas traditional voice-leading formulas
and historical compositional practice are more a question of musicological research and thus open
for discussion.

[4] Lachmann’s model does propose that different research paradigms can coexist within a single
project, thus, to our topic, allowing for and even suggesting the coexistence of stylistic perspectives
beyond harmonic tonality (and resulting in a more benign construct than the situation in
Riemann’s day, before the idea of historical contingency had been developed). For this reason, the
model seems to be much better suited to today’s constant struggle to reconstruct history. The
supposedly irreconcilable paradigms of traditional and parsimonious voice leading are bound to
melt in every analysis, whether one seeks to suggest a composer’s intention, the reception of the
music by contemporaries, or any other hypothesis serving as a springboard for the work. The
meshing of paradigms is important especially in the case of Romantic harmony because the voice-
leading models taught in theory and composition from about 1830 to 1910 were entirely wrapped
up in ongoing speculative discussion about tonality (Sprick 2012). Thus, they were modified and,
most importantly, abstracted.

1.2. Neo-Riemannian theories and analytical paradigms

[5] Neo-Riemannian theories replace the traditional logic of the tonal cadence (phrases based upon
harmonic progressions of fundamental fifths) with harmonic textures containing minimal voice-
leading work (that is, parsimonious voice leading), a model of triadic transformation that is a
practical application of mathematical group theory. Minimal voice-leading movement serves as a
basic tool to calculate triadic distance in a chromatic space. The idealized voice leading model is
influenced by a general notion of pitch-class set theory: it adopts the equal-tempered semitone as
the minimal work unit, rather than bestowing this label upon traditional chord progressions
related by fifths.

[6] While neo-Riemannian theories explicitly adapt post-1850 German music theory, they also
reinterpret historical music theory in an exceptionally creative way by linking two scientific
paradigms that tend to be understood as incommensurable. The methods and syntax of neo-
Riemannian theories originated from the diagrammatic paradigm (that is, from the scientific
method), but examining and hermeneutically interpreting music theory developed during the
Romantic era requires approaches more at home in the humanities (such as the mnemonic or
diegetic paradigm; Lachmann 1993, XXV). Once one begins to see the relevant achievements of
Idealist music theory as a substantial part of the cultural memory and self-image of the Romantic
era, traces of the mnemonic paradigm start popping up everywhere: in textbooks, in the
iconography of their exercises and musical examples, and in the loci communes (rhetorical
commonplaces) of different scientific and didactic approaches to the phenomenon known as
tonality.(1)

[7] Additionally, the mnemonic paradigm provides a model to help us understand how concepts of
music theory were taught in former times, a narrative that is marked by the rivalry between
nascent historicism and a marked fascination with the overwhelming progress of science,
especially in the time period that neo-Riemannian theories attempt to describe in a new and radical way (Schnädelbach 1987, 128).

[8] Thus it would seem inescapable that, in the confrontation between historical harmonic theory and its quasi-timeless, systematic revision, one’s perspective must oscillate between documentary and constructive methods (Schnädelbach 1987, 146–7). Therefore, an eclectic approach can be understood not as detracting from scholarly standards but as a part of the process of hermeneutic analysis.

[9] Even after thirty years, the novelty of the fusion of transformational theory with traditional theories of Romantic harmony sometimes makes one forget that scientific method is only one part of the model. The analytical focus, the aspects of Romantic harmony dismissed by the theory, and all analytic practice are based upon numerous historical, hermeneutic considerations and decisions. Despite the textbook-like construction, the high didactic quality, and the mathematics-based infallibility of its tools and diagrams, neo-Riemannian theories are founded upon the unstable device of superimposing mathematics on reinterpreted Romantic theory, a situation that serves to highlight the question of which aspects of historical theory are reinforced, reinterpreted, or even dismissed in the process of evaluating the adequacy of this approach for the musical situation examined.

[10] A single instance within the far-reaching and partly inhomogeneous field of neo-Riemannian theories will be discussed in part 2 below, but that will be sufficient to arrange a fruitful collision of transformational logic and concrete voice leading. I will use the theoretical perspective and terminology of a “Weitzmann region” as described by Richard Cohn in his study of the augmented triad and the underlying structures it generates in Romantic harmony (Cohn 2012). A clear distinction between categories will prove just as necessary as the controlled cross-fading thereof.

[11] The analyses of music by Brahms and Schubert that follow in part 3 will scrutinize two aspects of the augmented triad as found in neo-Riemannian theories. In doing so, critical comments aim to enrich the methods employed, while the interdependency of competing paradigms may sharpen our understanding of the cultural context.

2. Critique of Weitzmann’s Der übermässige Dreiklang (1853)

[12] Basic to my argument here is the observation that the augmented triad appears in at least two categories of music theory and pedagogy around 1850: in the first case as a trope of thorough-bass practice, in the second case as a focal point in the modern, speculative music theory that emerged from the circle of theorists led by Moritz Hauptmann. The discussion in the second instance was anything but homogeneous: Hauptmann adopted a timeless, philosophical perspective, but Carl Friedrich Weitzmann, although he took advantage of the systematic depictions and intellectual approach derived from Hauptmann, advocated the historically defined position of the stylistic avant-garde and musical modernity (Weitzmann 1853, 32; 1861, 1, 4, and passim). Highlighting the systematic and symmetrical aspects of Weitzmann’s publications, along with the obvious similarities between Weitzmann’s diagram-rich style and the general ideas of pitch-class set theory, represents a creative interpretation that can be found in some more recent American music theory.

2.1. Two different tropes of the augmented triad: 5–6 oblique motion and tonal dualism

[13] Despite its apparently systematic design, Weitzmann’s essay on the augmented triad leaves some gaps in its narrative, and the musical examples are noticeably inconsistent. Even a largely positive reviewer, writing in the May 1854 issue of the Niederrheinische Musikschrift (Reviewer D. 1854, 17), points out omissions in the essay’s historical sketch as well as some irregularities in the description of the triad’s “natural origin.” A possible explanation for these appropriately observed problems in Weitzmann’s text could lie in the fact that he generally did not document information derived from his various sources and he added little or sometimes no commentary.

2.1.1. Consecutio per quintam ad sextam
[14] One of Weitzmann’s first musical examples presents the augmented triad as a transitory chord: The oblique motion from the fifth to the sixth is intensified by chromatic alteration of the fifth (Weitzmann 1853, 3). See Example 2. In the context of this voice-leading model, the sound of the augmented triad is a formula for ascending sequences already known in seventeenth-century rhetorical, gestural styles, and which by the nineteenth century had been long since established.

[15] In nineteenth-century music theory this Stimmführungsmodell is still alive as an exercise in thorough-bass pedagogy. Although the superficial similarity to parsimonious voice leading is striking, there is a categorical gap: the addition of chromatic passing tones to an existing contrapuntal texture is optional and may be done in order to intensify the musical expression. By contrast, chromatic triadic transformations through parsimonious voice leading are not a question of creativity and arbitrariness. The intermediate semitone step of the augmented triad bridging the R-transformation is not falsifiable in a scientific sense, but instead appears as an indicator of a source in a traditional voice-leading background. (2)

2.1.2. “Nebenverwandt”—remnants of dualism

[16] It is well known that the N-transformation is characteristic for the Weitzmann region (Cohn 2000, 92; 2012, 56, 61–62). Neo-Riemannian theories distinguish its transformational nature from the diatonic falling fifth of the chordal root by the label “nebenverwandt,” which was taken from the Weitzmann essay under discussion here. According to Cohn, the term “nebenverwandt” describes the transformation from a major triad into a minor triad one fifth below through the voice leading movement of two half-steps in the same direction. The mediation through an augmented triad that is one half-step away from each of the nebenverwandt chords is essential to the character of the transformation.

[17] The basic non-directional nature of neo-Riemannian transformations, however, makes it difficult to apply the N-transformation as an analytic tool. As a symmetric relation between a major triad and a minor triad one fifth below, the N-transformation loses contact not only with German music theory of 1850 but also with the “second nature” of transformations, which ought to qualitatively transcend a simple cadence.

[18] Here again, the origins of this inconsistency can be traced back to the relatively poor contextualization characteristic of Weitzmann’s essay. (3) In contrast to his first musical examples, which were offered as part of the historical sketch, he now proposes that the “natural origin” (natürliche Entstehung) of the augmented triad is derived from the dualist symmetry of a major chord and its minor subdominant chord as an inversion. In referencing this kind of symmetry, Weitzmann follows a tradition of music theories and textbooks since at least Marpurg’s translation and commentary of d’Alembert’s Éléments de musique (Marpurg 1757, 14–6). Weitzmann almost certainly learned the system during his studies with Hauptmann and later from Hauptmann’s book (1853, 39), especially in the context of the dualist idea of Moll-Dur-Tonart. According to Hauptmann the Moll-Dur-Tonart is a tonal system (Tonartsystem) in which the tonic major triad and its negation, the minor subdominant triad, are opposite poles. It is notable, however, that he relaxes his strictly systematic mode of thought for just a moment in order to make a brief comment about style and the musical relevance of the Moll-Dur-Tonart:

Although this Moll-Dur-Tonart can hardly be considered the main key of a musical piece, it seems to be applied rather often in the course thereof; more frequently in the sentimental genre of modern music than in older music. This tonal system is present when the diminished seventh chord resolves into the tonic major triad; in fact, it is embodied wholly in the notes of these two chords. Likewise, it exists generally in the plagal cadence from the minor subdominant chord to the major triad of the tonic. This key has a diminished triad of the second scale degree, an augmented triad, and the augmented sixth chord in common with the minor tonality, and none of these chords refer specifically to a minor tonic. (Hauptmann 1853, 40, my translation)

[19] When Hauptmann discusses the augmented triad specifically, he again abandons his dualistic thinking for a few sentences to make some stylistic observations supporting his argument that the
augmented triad is seated on the minor third of the subdominant. He points out that, in addition to
the appearance of the chord in the Moll-Dur-Tonart on the third of the subdominant, there is an
alternative origin, namely the chord A–C–E–G in the key of E minor as suspension of the ii6 chord A–C–E–F♯, which he understands as more organic than the chord G–B–D♯ built on the third of the tonic (Hauptmann 1853, 155–7).

[20] Within his Moll-Dur-Tonart scheme, however, Hauptmann defines the relation that Weitzmann
later describes in one instance as “nebenverwandt” — and from which Cohn later developed the N-
transformation and the implications of the intermediary augmented triad — as explicitly vectorial,
that is to say as the tension between a major tonic and the region of its minor subdominant
intensified in the play with the chromatically altered sixth scale degree. (4)

[21] Weitzmann (1853, 16) discusses the Moll-Dur-Tonart only briefly and without context, so that
the critic of 1854 took him to task for unexpectedly putting the “natural origin” of the augmented
triad on the third of the minor subdominant chord instead of simply altering the fifths of the tonic,
dominant, and subdominant chord. The reviewer continues:

[Weitzmann] writes further that “In major tonality it (the augmented triad) has its seat
on the tonic, on the dominant, and on the subdominant etc.” This is nothing else than
what is generally taught, but it does not agree with the content of the essay’s sixth
paragraph, which treats of the most natural generation of the most important
augmented triad in every key (“die natürlichste Entstehung des einer jeden Tonart
wichtigsten übermässigen Dreiklanges”). In the key of C major the triad A± C–E is
declared to be the principal augmented triad. In spite of the author’s best efforts it is
barely understandable by what right he can make such a statement, because this chord
occurs very less frequently in C major than the augmented triads that arise from the
augmented fifths of the tonic’s, dominant’s, and subdominant’s chords. (Reviewer D.
1854, 17, my translation)

[22] A closer look at the Romantic sources reveals a harmonic profile of the Nebenverwandtschaft
stronger than that of Weitzmann’s descriptions. Hauptmann’s hypothesis of dualist symmetry
between a major tonic and its minor subdominant is inspired by contemporary harmonic clichés
such as the altered plagal cadence, the diminished seventh chord, and other formulas involving the
flat sixth of the major tonality, and therefore he tries to integrate those various harmonic
phenomena into a kind of tonal “theory of everything.” A decidedly subdominant-leaning profile
is a substantial thread in the history of nineteenth-century harmony, not the brain-child of
Hauptmann’s speculative music philosophy. In trying to merge his systematic approach with the
musical and sensual experience of the music of his day, Hauptmann regards the region of the
minor subdominant as a counterbalance to the dominant’s region and it provides him an argument
for the aesthetic relevance of tonal dualism.

[23] Weitzmann’s comparatively weak echoes of this important school of thought — which was still
relevant for Arnold Schoenberg (1922, 270–287) — are too crude either in the description of the
augmented triad’s symmetry or, even more troublesome, in his inconsistent labeling of “hard
minor” (härteres Moll) as representing normality and “soft major” (weicheres Dur) (Weitzmann 1860,
10) as representing a specialty of Romantic harmony, with the result that he muddles these deeper
concepts of Hauptmann’s. These qualities unfortunately limit the influence of Weitzmann’s thought
on seminal movement on the development of neo-Riemannian theories. Whether the loss of
dialectic and stylistic information is due to the visionary or the fragmentary character of
Weitzmann’s writings is barely relevant because any historical reference to Romantic music theory
depends on the intellectual standards as articulated in contemporary publications and reviews,
including criticism of Weitzmann’s inadequate way of dealing with the work of both predecessors
and contemporaries.

[24] A simple application of the N-transformation in an analysis thus bears the risk of
informational loss when N is applied to a basic minor cadence, making the hybrid plagal relation
into a simple root progression of a falling fifth and thus the “inverted” chromatic plagal relation
into a simple half-step transformation. Doing so elides the dialectic of the tonic’s tension in relation to its minor subdominant.

[25] The problems described above connected with the N-transformation belong to the larger complex of harmonic phenomena resisting any strictly one-to-one comparison of diatonic fifth-based harmony and the idea of semitone triadic transformation; these phenomena have to be approached, discussed, and resolved outside of these systematic frameworks. In other words, they call for a creative mix of both harmonic systems. The structures of Lachmann’s mnemonic paradigm may ground a more adequate analytic approach because these give more priority to theoretical models backed by historical tradition than they do to systematic logic. Sharpening the systematic parts of neo-Riemannian theories through a historically informed corrective follows ideas quite similar to the supporting models and constructive criticism of Steven Rings (2007) and Daniel Harrison (2011, 553), both of whom point out the possibility of coexistent systems, or, as Richard Cohn (2012, 171) puts it, of double syntax. Rings’s model of “syntactical interaction,” in particular, seems to have inspired the compromise of Cohn’s “double syntax,” which allows the kind of juxtapositions necessary, although it remains difficult to control the possible interaction of the different paradigms (2012, 171ff, 183ff). This interaction becomes an important feature of analysis in some compositional contexts, as in the case where the structural role of an augmented triad in a tonal modulation driven by that triad’s construction is independent of whether the triad is actually played or not (as shown by Cohn); sometimes the combination of surface-level voice leading and higher-level structure is not a coincidence. For the implications of the Nebenverwandtschaft, thinking in terms of “double syntax” can be an effective approach to describing enharmonic ambiguity and oscillation around the Tonnetz—even within complex tropy like the “double-agent complex” (Cohn 2012, 72-78)—in the whole sensual fullness of harmonic information.

3. Analysis

[26] Oblique motion from the fifth to the sixth above the bass as an elementary voice-leading model is the starting point of Simon Sechter’s Praktische Generalbass-Schule (1835)—see Example 3. Thus we cite Sechter—as we did Fétsis in the opening of this article—as a contrasting contemporary witness because of the similarity to transformational theory in his focus on common tones. Here, as earlier, however, we must emphasize that the treatment is founded on entirely different theoretical principles.

[27] Sechter’s curriculum in this textbook uses a spiral method of instruction, and when he returns to the opening pattern in the tenth exercise he introduces chromatic elaboration (Auskomposition); see Example 4. In the intervening exercises, a variety of styles appear, from beginner’s tasks reduced to skeletal triadic progressions to standard voice-leading examples and small preludes compiled from the tradition of organ improvisation and partimento patterns. Often those examples where Sechter’s intuitions for didactic progress allow the use of dissonance seem to be more natural and relaxed than the consonant reductions.

3.1. Brahms, “Feldfeinsamkeit,” op. 86, no. 2

[28] Johannes Brahms’s “Feldfeinsamkeit,” op. 86, no. 2, implements as a motivic germ the step from the fifth to the sixth scale degree with the augmented fifth as chromatic passing tone—see Example 5. This works as a Schoenbergian “motive of variation,” or guiding idea, for comprehension of the song’s formal design, and the same time its rising motion intensifies the sense of the text (in Example 5 “... und sende lange meinen Blick nach oben”: “and for a long while turn my gaze above”).

[29] The usual harmonization of a melody involving the augmented triad is the basic motive of the traditional Montesusenz (an ascending +4−3 sequence; Riepel 1755, 44), which is employed in the following phrase beginning in m. 12—see Example 6 (“von Himmelsblüe wundersam umwoben”: “in wonder enveloped by the heavens’ blue”): bass F−B♭−G−C−A−D. The two other variants of the sequence seem to behave as a diatonic and dissonant foreshadowing in mm. 5−6 (bass F−D−G with
the alluded fundamentals E and A in m. 7) and as a consonant yet transformed result in mm. 21–23—see Example 7 ("durch's tiefe Blau wie schöne stille Träume": "through the deep blue like beautiful quiet dreams"). The C♯, initially no more than a chromatic passing tone, gains the quality of a harmonic root, as though the sudden change to the key of F minor introducing the enharmonic D♭ had generated the needed potential energy.

[30] In this musical narrative of developing variation of the motive C–C♯–D, a dissonant passing note forges into a new terrain of harmonic stability and evenness. As with Sechter, so with Brahms: we see once again not traces of a historic process leading from diatonic to chromatic models but logical development from a diatonic but dissonant germ to a new quality of chromatically transformed consonance. It is this very development that is part of the music's story. There are certainly frequent connotations that would dismiss diatonic variants as archaic, especially in the music of Richard Wagner, but the notion of a strict historical distance between diatonic and chromatic alternatives does not represent true compositional history. To analyze what was in fact a haphazard compositional transition from diatonic to chromatic harmony, an approach is needed that focuses simultaneously on the historical contingency of voice leading and the systematic perspective of transformational logic. In the case of "Feldeinsamkeit," it was most likely the composer's intention constantly to assign various qualities of harmonic cognition and perception to the very same pitches throughout the whole song.

3.2. Schubert, Symphony in C major, D. 944, I

[31] As an example of the dynamics of a "Weitmann region," Cohn analyzes a passage from the end of the development of Schubert's C major Symphony, D. 944, first movement—see Example 8. The region around the augmented triad A♭–C–E is traversed by means of an N–R chain. The remnants of traditional voice leading, which are not reflected in parsimonious voice leading, are shown in the suspension chain of the upper voices and in the fact that every first chord of the sequenced pattern is a dominant seventh chord.

[32] The major third relation is already highlighted in the introduction to this movement, starting in a diatonic form—see Example 9. The double counterpoint at the tenth, already predictable in the unison beginning, is a telling feature as it enables the transposition of phrases at the critical interval.

[33] During the modulation returning to the main key, the first chromatic chord progression is heard—see Example 10. This E minor episode anticipates and later grows into a subordinate theme of the subsequent sonata form, where the PL-transformation of the introduction is reintroduced in a compact motivic variant closing a diatonic sequence, the “Parallelismus” (Dahlhaus 1967, 92)—see Example 11.

[34] The juxtaposition of a triad against the dominant seventh chord a third below (a juxtaposition by memory, because the C♭ or B-major 6th-chord appears the second time instead of the E♭ major chord, the dominant) is elaborated in the continuation of the “Parallelismus-sequenz” and now presents a clear anticipation of the N–R chain described by Cohn: the motive in the trombone links the E♭ major triad and the B dominant seventh chord, the same harmonic relation as in the introduction—see Example 12.

[35] The “Parallelismus-sequenz” went through such a variety of modifications and abstractions in the course of the nineteenth century that merely labeling it or tracing it back to its origins in Renaissance polyphony does not help determine its position in Romantic harmony. It might, nevertheless, be relevant that the pattern’s second chord is often substituted by a chromatically-inflected variant generating a six or six-five chord, a more transitory element. Sechter calls this variant of the sequence the primary form—see Examples 13, 14, and 15. It is of some interest for the technical background of the Schubert passage that Sechter’s compendium shows both variants and that even the chords generated by chromatic inflection are not bound to the original bass line by becoming new root chords—see Example 16.
[36] In comparing the symmetry of the cited sequence with Sechter’s collection of voice-leading formulas, it is remarkable that Schubert’s voice leading, modeled with uncanny precision and coming dangerously close to “parsimonious voice leading,” nevertheless adheres as closely as possible to the traditional counterpoint of the sequence — see Example 17. In this regard, it is not insignificant that the dominant seventh chords take up the remnants of the six-five chords, and that the suspension chain is essential. We may further note that even the whole-tone scale in the trombone bears traces of a traditional bass figuration.

[37] In employing identical motives, instrumentation, and even pitches throughout all variants, Schubert seems to encourage the listener to cross-fade the diatonic and chromatic alternatives. Because the “Parallelismus-sequence” is in fact derived from the scale rather than from the triad, the dominance of triads played in the modified sequence at the end of the development is the product of the developing variation, whose sensual effect is felt and recognized in the synthesis of both the concrete and the virtual voice leading.

[38] The introduction of the symphony presents not only E minor as the upper third relation but also A-flat major, which is reached in the typical manner through a deceptive cadence borrowed from the parallel minor and is left by a singular variant of a Phrygian cadence. Thus, the augmented triad that structures the aforementioned N–R-chain already appears in the tonal layout of the introduction. The harmonies remodeling the Phrygian cadence provoke a breathtaking interaction of virtual and concrete voice-leading — see Example 18 (7) Note that the development of the first chromatic chord progression modifies a common voice-leading pattern by transposing the chromatic counter-voice of the diatonic tetrachord a third upwards. The synthetic harmony over the A♭ pedal point combines the motivic symmetries of the melodic steps in the striking progression from a D♯ minor triad to an F minor triad — see Example 19. This generates the harmonic neologism with the even more perfect symmetry of the harmonic substructure, anticipating the essence of the movement’s harmonic layout by a variant of the “double agent complex” (Cohn 2012, 72–6) — see Example 20. The dualist aspect of an amplified and, so to speak, “darkened” subdominant region is dialectically comprised of the framework of voice-leading symmetry very close to the background presentation of its parsimonious voice-leading work.

4. Conclusion

[39] It can be useful for analytical work to understand the apparent conflict between traditional diatonic models and chromatic transformations not as a matter of a hypothetical historic development separating the Baroque and Romantic eras but as an essential facet of the aesthetic possibilities available to nineteenth-century composers. In both works analyzed here — the song by Brahms and the symphony by Schubert — tension and form arise via controlled cross-fading of different harmonic levels. By means of harmony, dissonant and transitory events can find stability and evenness when background voice leading is understood as movement through a deeper dimension.

Footnotes

1. Idealist music theory is 19th-century music theory that deals with ideas drawn from idealist philosophy, e.g. Marx, Hauptmann, Riemann, Weitzmann, or even Schoenberg or Sechter. For the interaction of different paradigms see Lachmann 1993, XVIII.

Return to text

2. If the R-transformation is based on the symmetry of the augmented triad—and this is the case—this triad is not falsifiable, i.e. one can neither skip it, nor restore a diatonic version.

Return to text

3. Cohn 2012, 57. “Although Weitzmann’s ordering has transformational implications that we will consider . . . , for him that ordering evidently held no value except as an aid to memory.”

Return to text

4. Weitzmann uses the notion of nebenerverwandt to describe other harmonic situations as well. For example: “Ein Ton wird erst durch Nebentöne zum Haupttone, ein Accord erst durch Nebenaccorde zum Hauptaccord. In der Unter- und der Oberquinte wird der Hauptton, die
Tonica, seine nächsten Verwandten, seine Dominanten, erkennen” (1860, 9).

5. Here C major-6/4 is a surrogate for G major, modified by suspension; the G♯ in the bass is part of the diminished-seventh chord g♯ b–d–f with the implied fundamental E. This leads as a dominant to A–minor: D–G–E–A, which is a standard variant of the sequence in question.

6. The passing note in the upper voice with the E♭ and the G♭ comes very close to a dominant 6/5 chord (d♭–f♭–b–a). So Schubert’s voice leading is similar to the voice leading of a Parallelismus sequence, whose diatonic fundamentals E♭7–A♭min–C♭7–F♯maj are altered to C♭7–F♯min. A more traditional variant of this sequence occurs in the middle section of Erste Walzer D.365 no. 2 (mm. 9–12). The chords are in the same key, but F♮-major appears instead of F♭ minor.

7. Neo-Riemannian transformations often refer to a middle ground level, i.e. they are the result of analytic reduction. It is neither self-evident nor trivial to point out that foreground and middleground are integrated in a synthetic and very special form of the Phrygian cadence: While the flattened sixth degree of C-major, A♭ is used to build a Phrygian cadence in the context of a major key, this effect is increased by the subdominant of A♭-min. The sixth degree, A♭, thus is both confirmed as tonal center and transformed back to C major/minor at the same time, and this occurs by keeping as much as possible the simple voice leading shape of a traditional Phrygian cadence in C-major/minor.
